OP-8000 optical amplifier modules provide multi-function, low noise, Erbium-Doped Fiber Amplifier (EDFA) solutions that are ideal for metro Dense Wavelength Division Multiplexing (DWDM) applications.

Product Image

- The OP-8000 Frame of C-Band EDFA Optical Amplifiers is part of the OP-8000 optical multi-service transmission platform solution. Many model options serve all the traditional amplifier applications in an extended optical link: booster, in-line, and pre-amplifier
- A **booster amplifier** operates at the transmission side of the link. It features high input power, high output power, and medium optical Gain . Boosters are designed to amplify aggregated optical input power for reach extension.
- An **in-line amplifier** operates in the middle of an optical link. It features medium to low input power, high output power, high optical Gain , and a low noise figure. In-line amplifiers are designed for optical amplification between two network nodes on the main optical link.
- An **in-line amplifier** operates at the receiving end of an optical link. It features medium to low input power, medium output power, and medium Gain . Pre-amplifiers are designed for optical amplification to compensate for losses in a demultiplexer located near the optical receiver.
- Some EDFA models include an additional mid-stage port designed for insertion of a Dispersion Compensation Management (DCM) unit without its inherent insertion loss. The design of these models maximizes the DCM benefits to increase deployment flexibility. New placement options require fewer amplifiers in the link, and they can open the door to applications that were not possible with older technology.
- Some EDFA models include an Red and blue port designed for Single fiber DWDM Solution. The design of these models is used for single-fiber

Highlights

- Three Optical Amplifier C-Band applications:
Booster
In-line
Pre-amplifier
- Applications:
Metro DWDM distance extension
Single wavelength distance extension
- Low noise figure: typ 5dB
Gain flattening filters (GFF) assure flat Gain (<1 dB variance) over the entire amplified band
(Wide-Band models only)
- Multiple operating modes:
AGC adjustable Gain ,
APC output is adjustable,
ACC voltage adjustable
- Transient response control: high performance transient response control to ensure power, Gain and stability, without affecting existing

➤ customization:

Support more saturated output power 13 ~ 24dBm customization

Support a variety of specifications 8 ~ 35dB Gain customization

Support red and blue port ,The design of these models is used for single-fiber DWDM transmission systems.

➤ Midstage access:

Designed for insertion of a DCM unit without its inherent insertion loss.;

Designed for insertion of a OADM unit without its inherent insertion loss;

➤ Advanced network management features:
Optional OSC management channel for remote management

MON own monitoring port, on-line monitoring optical power and OSNR

Supports SNMP, Web, console management;

➤ OP-8000 chassis compatibility

Fit OP-8000-1U 1-slot powered chassis

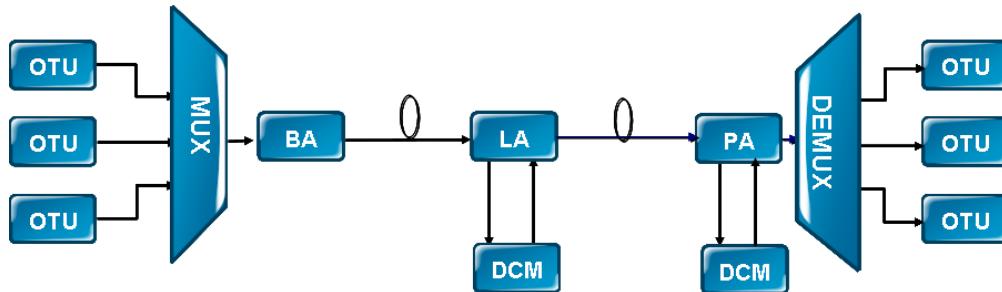

Fit OP-8000-2.5U 8-slot powered chassis

Fit OP-8000-6U 16-slot powered chassis
